

Fig. S3. Localization of the subpectoral lymph nodes with uptake of radiocolloids with regard to the European Society for Therapeutic Radiology and Oncology (ESTRO) and Radiation Therapy Oncology Group (RTOG) contours. All subpectoral lymph nodes are covered by both ESTRO and RTOG contours. Very close location of subpectoral nodes to thoracic vault demonstrates the necessity to cover anterior surface of the I–III ribs. RTOG contours (yellow), ESTRO contours (green), subpectoral lymph nodes (brown), anterior pectoral (green), central (red), lateral (blue), and interpectoral (light green).
